# A Discussion of Disease Prediction and Model Validation

Greg Ridgeway  
RAND Statistics Group

August 13, 2008

# *A few comments, additions, and views*

## Introduction

- ❖ A few comments, additions, and views

## Calibration

## Modern prediction methods

## Weight of evidence scorecard

## Conclusion

- Brier score: a useful decomposition of discrimination and calibration
- Modern statistical prediction methods:  $L_1$  shrinkage with lots of covariates
- Weight of evidence scorecard

# Gönen: Calibration matters

Introduction

Calibration

❖ Gönen:  
Calibration matters

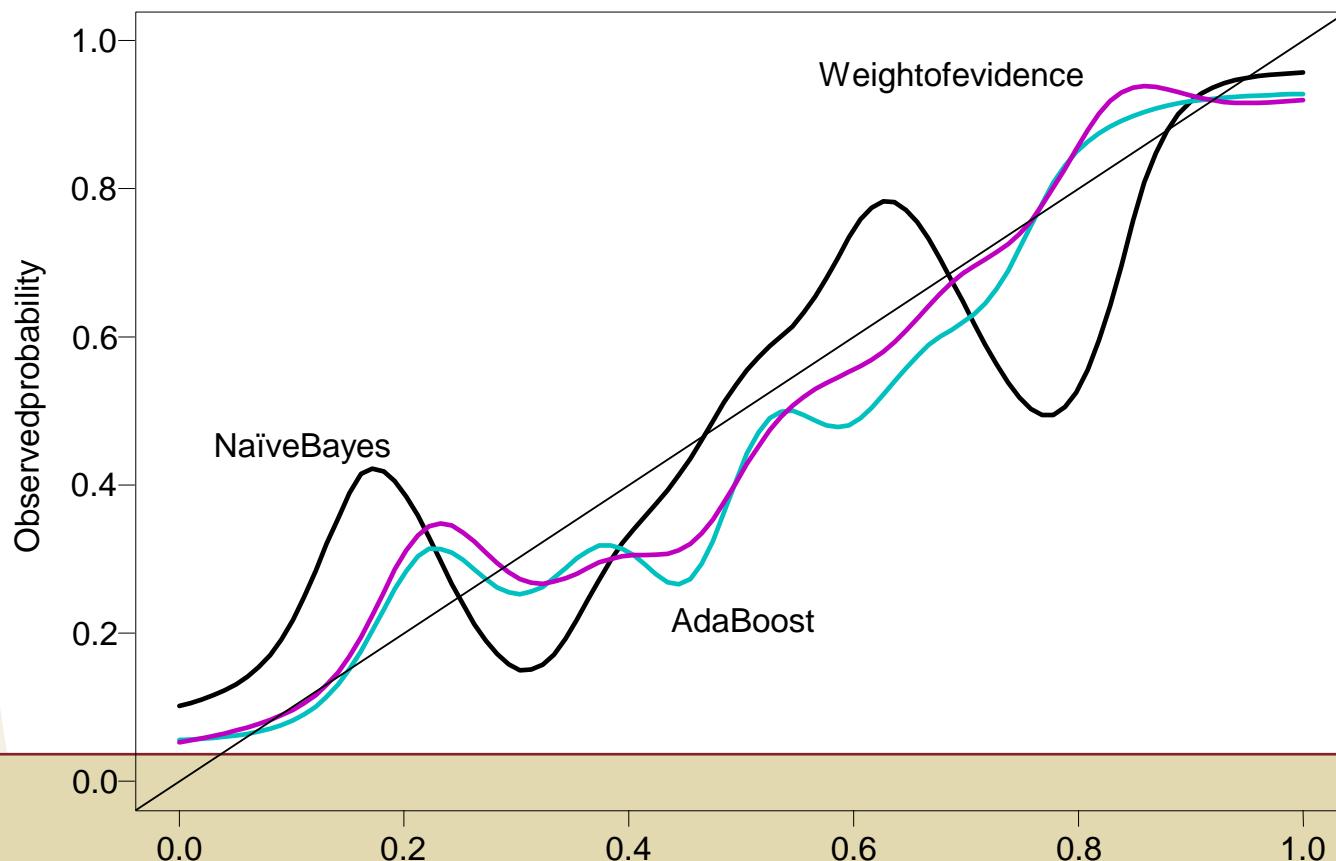

❖ Brier score

Modern prediction  
methods

Weight of evidence  
scorecard

Conclusion

- Better performance through improved calibration - criticized at a data mining conference as irrelevant
- Yates (1982) suggested that organizational psychologists were too focused on calibration

# Brier score

Introduction

---

Calibration

---

❖ Gönen:  
Calibration matters

❖ Brier score

---

Modern prediction  
methods

---

Weight of evidence  
scorecard

---

Conclusion

---

$$\frac{1}{N} \sum_{i=1}^N (y_i - p(\mathbf{x}_i))^2$$

$$= \bar{y}(1 - \bar{y}) - \frac{1}{N} \sum_{k=1}^K n_k (\bar{y}_k - \bar{y})^2 + \frac{1}{N} \sum_{k=1}^K n_k (p_k - \bar{y}_k)^2$$

= uncontrollable variation + resolution + calibration

- Resolution is large (very negative) when we can discriminate the 0 outcomes from the 1s, when the average outcome given prediction  $p_k$  near 0 or 1
- Calibration is the ability to assign meaningful probabilities to the outcomes.

# ***Sun & Bang: Logistic regression***

[Introduction](#)

---

[Calibration](#)

---

[Modern prediction  
methods](#)

**❖ Sun & Bang:  
Logistic regression**

**❖  $L_1$  shrinkage and  
regression**

[Weight of evidence  
scorecard](#)

---

[Conclusion](#)

---

- Indicate good out-of-sample predictive performance
- Both carefully handled data (e.g. survey weights, correlations)
- Modern statistical prediction methods might squeeze out more signal, especially with  $N = 12,000$

# $L_1$ shrinkage and regression

Introduction

Calibration

Modern prediction  
methods

❖ Sun & Bang:  
Logistic regression

❖  $L_1$  shrinkage and  
regression

Weight of evidence  
scorecard

Conclusion

$$\ell(\beta) = \sum_{i=1}^n y_i \beta' \mathbf{h}(\mathbf{x}_i) - \log \left( 1 + e^{\beta' \mathbf{h}(\mathbf{x}_i)} \right) - \lambda \sum_{j=1}^J |\beta_j|$$

- Let  $\mathbf{h}(\mathbf{x})$  be piecewise constant functions of the  $x_j$ s and their interactions,  $I(BMI < 20)$ ,  $I(COPD \text{ Hx=NA})$ , or  $I(\text{age} < 40)I(\text{waist} > 90)$
- Efron *et al* (2004) LARS essentially showed that boosting essentially implements this, but avoids constructing the full design matrix
- The `gbm` package in R implements this

# Spiegelhalter & Knill-Jones (1984)

Introduction

---

Calibration

---

Modern prediction  
methods

---

Weight of evidence  
scorecard

❖ Spiegelhalter &  
Knill-Jones (1984)

❖ Weights of  
evidence

❖ Evidence balance  
sheet

Conclusion

---

- Report: "Despite encouraging results in a research context, statistical systems have had limited practical impact"
- Suggest the failure of statistical systems results from being *too simplistic, inapplicable, and incomprehensible*
- Present a weight-of-evidence scorecard that accommodates "ignorance" and "conflict of evidence"

# Weights of evidence

Introduction

Calibration

Modern prediction  
methods

Weight of evidence  
scorecard

❖ Spiegelhalter &  
Knill-Jones (1984)

❖ Weights of  
evidence

❖ Evidence balance  
sheet

Conclusion

$$\begin{aligned} WOE &= \log \frac{P(Y = 1 | \mathbf{X} = \mathbf{x})}{P(Y = 0 | \mathbf{X} = \mathbf{x})} \\ &= \log \frac{P(Y = 1)}{P(Y = 0)} + \log \frac{P(X_1 = x_1 | Y = 1)}{P(X_1 = x_1 | Y = 0)} + \dots \\ &\quad + \log \frac{P(X_d = x_d | Y = 1)}{P(X_d = x_d | Y = 0)} \\ &= w_0 + w_1(x_1) + \dots + w_d(x_d) \end{aligned}$$

- All of the probabilities can be calculated in a single scan of the dataset
- They also propose shrinking the estimates with a logistic regression  $\beta_0 + \beta_1 w_1(x_1) + \dots + \beta_d w_d(x_d)$

# *Evidence balance sheet*

Introduction

Calibration

Modern prediction  
methods

Weight of evidence  
scorecard

❖ Spiegelhalter &  
Knill-Jones (1984)

❖ Weights of  
evidence

❖ Evidence balance  
sheet

Conclusion

Evidence in favor of chronic		Evidence in favor of acute	
Tingle	+22	Prior	-199
Depressed	+16	No leg pain	-2
Attention problem	+61	No hearing loss	-7
Insurance company = DMAB	+128	Marital status: Widow	-25
Lawyer	+174	French speaking	-28
<b>Total positive evidence</b>	<b>+401</b>	<b>Total negative evidence</b>	<b>-261</b>
<b>Total evidence</b>	<b>+140</b>		
<b>Probability of chronic whiplash</b>	<b>80%</b>		

# Conclusions

Introduction

Calibration

Modern prediction  
methods

Weight of evidence  
scorecard

Conclusion

❖ Conclusions

- Partnering prediction models with experts and the public offers opportunities to improve care, reduce costs, and avoid errors
- Significant barriers remain. We need to make them capture complexity, widely applicable, and understandable
- What better validation of progress is there than the CBS Early Show?
